

Please see this  
Presentation to  
understand how you  
can improve your daily  
life post laryngectomy.

Developed By

Prothsahan TEAM NGO

Laryngectomy Club Awareness Group

[www.prothsahanteam.org](http://www.prothsahanteam.org)

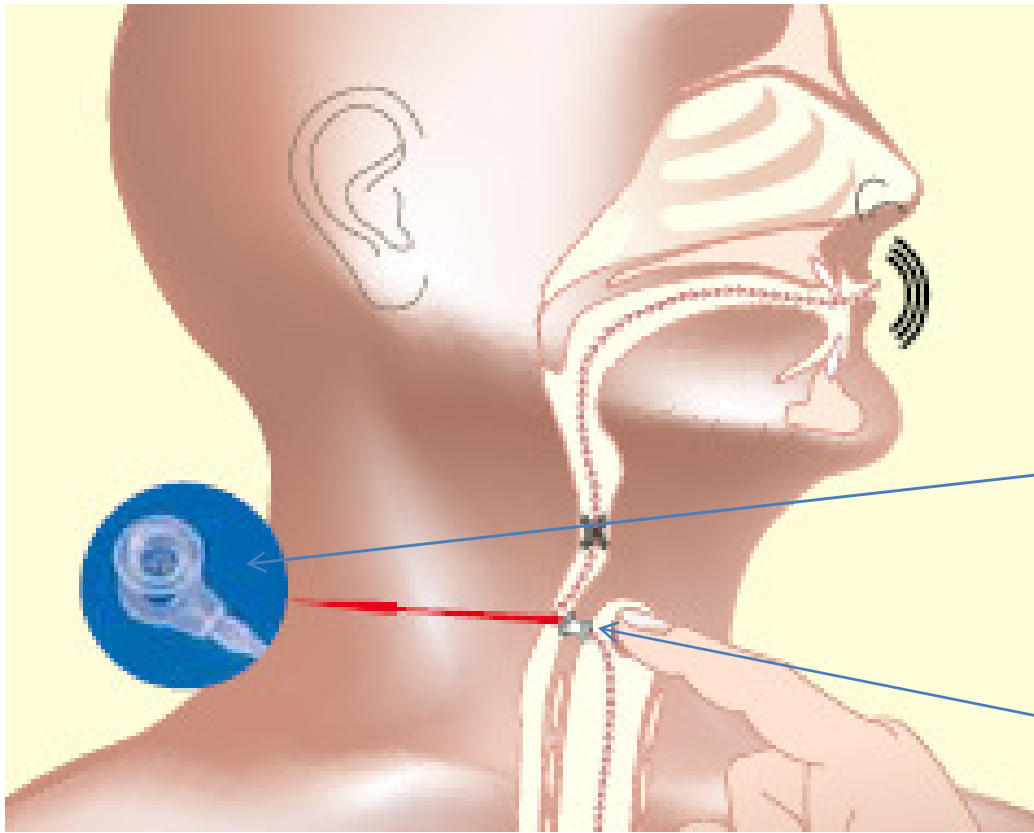

The normal person look like this.

After laryngectomy, one has got a stoma/opening on the mid of neck for breathing.

You have 3 options:

stomach/ esophageal voice is free, you need lot of practice but gives pain in abdomen, can't speak long sentences

Option Second  
is the internal Provox  
voice prosthesis  
Which fith in the wall  
of **esophegous** (food  
pipe to stomach) and  
**trechea** (air way to  
lungs) . you need  
practice.

Third option is to use an external vibrator device, called Trutone Electrolarynx. Which works as external electric larynx. you need practice.

With voice  
prosthesis  
You have to use  
thumb every time  
you speak, or take a  
handfree device  
attached to it,  
which is one way  
valve.

With electrolarynx you will have a  
electronic voice, little like robot

# Thanks !!

If you are capable  
Please make Donations for others  
who are not !!
